EXPERIENCE

Software Engineer II – Deloitte

July 2025 – Present

- Built a RAG pipeline on AWS using Amazon Bedrock for LLM inference, OpenSearch Service as a vector store, and Lambda for serverless document ingestion from S3.
- Replaced manual UI validation (up to 5 min/test) with automated headless tests in GitHub Actions using OIDC-based Workload Identity Federation with GCP, cutting regression time to seconds and gating every PR on coverage.
- Built an extensible Python load testing framework to validate service behavior under production-scale traffic patterns prior to rollout.
- Led security audit across two codebases with platform and security teams, identifying and remediating secrets exposure vulnerabilities before they reached production.

Software Engineer II – IBM Cloud

May 2021 – April 2025

- Designed and implemented a port-mapping feature for Virtual Private Endpoint gateways, allowing providers to expose their services on standardized ports regardless of backend configuration.
- Built reusable Go libraries used by multiple services to standardize data access patterns and reduce operational complexity.
- Served as a Designated Responsible Individual (DRI) for critical networking services, owning production reliability, leading incident response, and root-cause analysis during on-call rotations, and driving operational excellence initiatives.
- Contributed to internal API versioning tools used to manage backward compatibility across multiple services.

Software Engineer I (Contract) – Microsoft

Feb 2020 – Feb 2021

- Worked within an established C#/.NET backend codebase, contributing features and fixes while adhering to existing architectural and coding standards.
- Improved internal configuration tooling used to safely manage geographically distributed feature rollouts across large user populations.
- Integrated telemetry pipelines to collect and route system and usage signals at scale, supporting operational visibility and analytics.
- Developed backend components supporting the migration of ~85M user accounts with emphasis on data integrity and service continuity.

Software Engineer – Tata Consultancy Services

Feb 2019 – Feb 2020

- Built a Python-based backend microservice, containerized with Docker and deployed to Azure App Service, extracting structured data from images to support downstream processing workflows.

SKILLS: Go, Python, Kubernetes, Terraform, Distributed Systems Architecture, Cloud Infrastructure, CI/CD, Networking, Reliability, Amazon Web Services (AWS)

PERSONAL PROJECT: Built and deployed a full-stack application, owning frontend, backend APIs, and deployment to better understand system boundaries and operational tradeoffs.

EDUCATION: B.S. Computer Science, Washington State University

2015 – 2018
